1 About This Reference Manual

This document is a reference of all the Setting Values, Direct Commands and Signals of the MCA4. In other words, it lists all parameters that are available (or can be made available) with the (optionally) full featured versions of the MCA4 protection device.

CAUTION!

This document does not intend to give long and/or detailed description, nor does it intend to replace the full Technical Manual in any way. Only a quite short description is given for each parameter.

This document is a reference of all the Setting Values, Direct Commands and Signals of the MCA4.

Every HighPROTEC protection device operates using a lot of digital values of various types. Throughout our Technical Documentation, we are talking of “settings” (or “parameters”) or “signals” or “(measured) values”, depending on the type.

Please consult the Technical Manual, in particular Chapter “Modules, Settings, Signals and Values”, for details of the existing data types.

Modules

The firmware of every HighPROTEC protection device can be thought of being sub-divided in several independent function blocks, the so-called “modules”. Every protection function, for example, is a module of its own. But one of the fundamental concepts of a HighPROTEC protection device is to implement this with great consequence: The functionality of calculating statistical data is a module (named »Statistics«), every communication protocol is a module, the control of switchgear devices is a module (named »Ctrl«), but the properties of the switchgear itself is part of another module. There is even a general protection module (named »Prot«) that interacts all specific protection modules.

Every parameter, every value and every signal is therefore a member of some module.

But note that the settings dialogs (on the panel (HMI) or in the *Smart view* operating software) often omit the module name whenever it is clear from the menu branch. This means the parameters are often displayed only with their individual parameter names, i. e. simply *»Function«* instead of the full-blown *»I[1] . Function«*. This increases the overview and simplifies all configuration and operation work; however, it is good to know that the writing *»Function«* is just an abbreviation. In fact, **every** parameter **always** belongs to a module, and therefore – to make this concept absolutely clear – the reference tables have always the module name added in front of every parameter name

Especially for protection functions it is often required to have several instances active. For example, overcurrent protection usually has several “stages”, and all of these are running at the same time (using their individual setting values). Therefore it is an important feature of every HighPROTEC protection device that a lot of modules exist in several “instances”, which are numbered (in brackets): For the overcurrent protection, for example: »I[1]«, I[2]«, …

In the reference tables, usually every module has its own dedicated chapter, which lists the available number of instances at the beginning. Then, however, in the sub-chapters listing the various parameter types, only the first instance (e. g. »I[1]«) is mentioned, because all the other instances are identical anyway.

Structure of a Reference Table

Since (almost) every module can be activated or deactivated independently of the other modules and all parameters of an inactive module disappear from the menu branch it would not be helpful if this Reference Manual would list parameters sorted according to the menu structure. Instead, we list categories of modules (e. g. “Protection Functions”) and all the modules within a category.

For each parameter, there is a table with its properties, looking like this:

Module . Parameter	[Menu Path to This Parameter]	
Default Value For some parameters: • Availability restrictions	Value Range	Perm.
Type	*Short descriptive text explaining the functionality of this parameter.*	

“Type” is the data type of the parameter, which is denoted by a small icon. The following types are possible:

- Setting Parameter
- Direct Control
- Input State
- Signal (Output State)
- Statistical Value
- Counter
- (Measuring) Value
- Dialog — Such a dialog can feature several data objects using a special representation and/or functionality.

“Perm.” means “permission”, i. e. the access level and password that is required to modify the parameter. (Please refer to the “Security” chapter in the full Technical Manual for details.)

“ Adapt. Param.” means that this parameter supports Adaptive Parameter Sets. (See the “Adaptive Parameter Sets” section in the User Manual.)

For some parameter types (e. g. Input and Output States), the second row (default, value range, permission) is useless and therefore omitted.

Example of a parameter:

I[1] . **Mode**	[Device planning]	
non directional	Selection List Mode: -, non directional, forward, reverse	S.3
	general operation mode	

Released

This means that one can find the parameter in the menu [Device planning], and its values are picked from a selection list named “Mode”. The “⮡” arrow indicates a cross-reference (hyperlink) into the “Selection Lists” chapter, and a click takes you to a table that lists all available choices. The access level “S.3” means the access level “Supervisor-Lv3”, which is required to modify the parameter.

BO Slot X2 . **DISARMED Ctrl**	[Service / Test (Prot inhibit) / DISARMED / BO Slot X2]	
inactive	inactive, active ↳ active/inactive.	S.3
Enables and disables the disarming of the relay outputs. This is the first step of a two step process, to inhibit the operation or the relay outputs. Please refer to "DISARMED" for the second step.		

BO Slot X2 . **Disarm Mode**	[Service / Test (Prot inhibit) / DISARMED / BO Slot X2]	
permanent	permanent, timeout ↳ Mode.	S.3

CAUTION! RELAYS DISARMED in order to safely perform maintenance while eliminating the risk of taking an entire process off-line. (Note: The Supervision Contact cannot be disarmed). YOU MUST ENSURE that the relays are ARMED AGAIN after maintenance.

BO Slot X2 . **t-Timeout DISARM**	[Service / Test (Prot inhibit) / DISARMED / BO Slot X2]	
0.03s *Only available if:*	0.00s . . . 300.00s	S.3

The relays will be armed again after expiring of this time.

BO Slot X2 . **Force Mode**	[Service / Test (Prot inhibit) / Force OR / BO Slot X2]	
permanent	permanent, timeout ↳ Mode.	S.3

By means of this function the normal Output Relay States can be overwritten (forced) in case that the Relay is not in a disarmed state. The relays can be set from normal operation (relay works according to the assigned signals) to "force energized" or "force de-energized" state.

BO Slot X2 . **t-Timeout Force**	[Service / Test (Prot inhibit) / Force OR / BO Slot X2]	
0.03s *Only available if:*	0.00s . . . 300.00s	S.3

The Output State will be set by force for the duration of this time. That means for the duration of this time the Output Relay does not show the state of the signals that are assigned on it.

2.4.1.2 BO Slot X2: Direct Controls

BO Slot X2 . **DISARMED**	[Service / Test (Prot inhibit) / DISARMED / BO Slot X2]

This is the second step, after the "DISARMED Ctrl" has been activated, that is required to DISARM the relay outputs. This will DISARM those output relays that are currently not latched and that are not on “hold” by a pending minimum hold time. CAUTION! RELAYS DISARMED in order to safely perform maintenance while eliminating the risk of taking an entire process off-line. (Note: Zone Interlocking and Supervision Contact cannot be disarmed). BO Slot X2 . **Force all Outs**	[Service / Test (Prot inhibit) / Force OR / BO Slot X2]	
Normal	Normal, De-Energized, Energized Relay operating modes.	S.3
By means of this function the normal Output Relay State can be overwritten (forced). The relay can be set from normal operation (relay works according to the assigned signals) to "force energized" or "force de-energized" state. Forcing all outputs relays of an entire assembly group is superior to forcing a single output relay.		

BO Slot X2 . **Force OR1** **...** BO Slot X2 . **Force OR6**	[Service / Test (Prot inhibit) / Force OR / BO Slot X2]

Signal: CAUTION! RELAYS DISARMED in order to safely perform maintenance while eliminating the risk of taking an entire process off-line. (Note: The Self Supervision Contact cannot be disarmed). YOU MUST ENSURE that the relays are ARMED AGAIN after maintenance	

BO Slot X2 . **Outs forced**	[Operation / Status Display / BO Slot X2]
Signal: The State of at least one Relay Output has been set by force. That means that the state of at least one Relay is forced and hence does not show the state of the assigned signals.

CT . **IL1, IL2, IL3 Cutoff Level**	[Device Para / Measurem Display / Current]	
0.005In	0.0In ... 0.100In	S.3
The Current shown in the Display or within the PC Software will be displayed as zero, if the Current falls below this Cutoff Level. This parameter has no impact on recorders.		

CT . **IG meas Cutoff Level**	[Device Para / Measurem Display / Current]	
0.005In	0.0In ... 0.100In	S.3
The measured Earth Current shown in the Display or within the PC Software will be displayed as zero, if the measured Earth Current falls below this Cutoff Level. This parameter has no impact on recorders.		

CT . **IG calc Cutoff Level**	[Device Para / Measurem Display / Current]	
0.005In	0.0In ... 0.100In	S.3
The calculated Earth Current shown in the Display or within the PC Software will be displayed as zero, if the calculated Earth Current falls below this Cutoff Level. This parameter has no impact on recorders.		

CT . **I012 Cutoff Level**	[Device Para / Measurem Display / Current]	
0.005In	0.0In ... 0.100In	S.3
The Symmetrical Component shown in the Display or within the PC Software will be displayed as zero, if the Symmetrical Component falls below this Cutoff Level. This parameter has no impact on recorders.		

CT . **CT pri**	[Field Para / CT]	
1000A	1A ... 50000A	S.3
Nominal current of the primary side of the current transformers.		

CT . **CT sec**	[Field Para / CT]	
1A	1A, 5A ↳ Ratio prim/sec.	S.3
Nominal current of the secondary side of the current transformers.		

CT . **CT dir**	[Field Para / CT]	
0°	0°, 180° ↳ Polarity.	S.3
Protection functions with directional feature can only work properly if the connection of the current transformers is free of wiring errors. If all current transformers are connected to the device with an incorrect polarity, the wiring error can be compensated by this parameter. This parameter turns the current vectors by 180 degrees.		

CT . **ECT pri**	[Field Para / CT]	
1000A	1A . . . 50000A	S.3
This parameter defines the primary nominal current of the connected earth current transformer. If the earth current is measured via the Holmgreen connection, the primary value of the phase current transformer must be entered here.		

CT . **ECT sec**	[Field Para / CT]	
1A	1A, 5A ↳ Ratio prim/sec.	S.3
This parameter defines the secondary nominal current of the connected earth current transformer. If the earth current is done via the Holmgreen connection, the primary value of the phase current transformer must be entered here.		

CT . **ECT dir**	[Field Para / CT]	
0°	0°, 180° ↳ Polarity.	S.3
Earth fault protection with directional feature depends also on the correct wiring of the earth current transformer. An incorrect polarity/wiring can be corrected by means of the settings "0°" or "180°". The operator has the possibility of turning the current vector by 180 degrees (change of sign) without modification of the wiring. This means, that - in terms of figures - the determined current indicator was turned by 180° by the device.

If the pickup value is exceeded, the module/element will be started. The definition of Vn is dependent on both the Field Parameter »VT con« and the Setting Group Parameter »Measuring Mode«: If the measuring inputs of the voltage measuring card are fed with phase-to-ground voltages (»VT con« = "Phase-to-Ground") then the setting »Measuring Mode« = "Phase-to-Ground" means that Vn=VTsec/SQRT(3), and »Measuring Mode« = "Phase-to-Phase" means that Vn=VTsec. However, if the measuring inputs of the voltage measuring card are fed with phase-to-phase voltages (»VT con« = "Phase-to-Phase") then the setting of "Measuring Mode" is ignored and internally set to "Phase-to-Phase" instead, so that Vn=VTsec.

Ack via »C« key	Description
Nothing	*No elements can be simply reset via pressing the »C« key for a long time (ca. 1 second). This has the consequence that pressing the »C« key is only a shortcut to the Acknowledge menu, from which the user has to select the elements to be reset.*
Ack LEDs w/o passw.	*All LEDs are acknowledged (reset) via pressing the »C« key for ca. 1 second. No password has to be entered for this. The reset activity can be recognized from the fact that it always includes an LED test, i.e. all LEDs flash in red color for a second, then flash in green color for a second.*
